## Willow Creek Stewardship

January 22, 2026

### Geotechnical Testing – Bore Hole Drilling

Thank you for your patience last week as Northwest Hydraulic Consultants and In Situ Archaeology had their teams on site at Homathco Drive, on January 14-15.

The teams performed borehole drilling and testing on Homathco Drive. The work involved drilling holes with a diameter of 6" or less into the asphalt to collect data on the subsurface conditions. The target depth for the geotechnical assessment was 30 feet. The images below show the drill rig loading up to move to the second site; another shows the blue-grey clay present at about 20-30 feet below surface – which is understood to be very common around the community. The holes were patched with cold mix asphalt afterwards.
